

Safe File Storage

Storage Type	Current State	Future State
Local Storage (e.g. C: drive)	• Technically available but should be avoided. • Files can be lost in the event of hardware failure or device loss.	• Not used for file storage under any circumstances. • Should store the operating system and apps only.
Personal OneDrive	• Inconsistently used. • Has been adopted by most users for personal file management, but not fully.	• Your primary personal workspace. • Default location for individual drafts, WIP, and private files.
Network Drives (B:, P:, R:)	• Actively used legacy shared storage location. • Hosted on AWS server, requires VPN access.	• Decommissioned on the server side. • Migrated from AWS server to SharePoint for access anywhere without VPN.
SharePoint Sites	• Testing collaboration capabilities for specific teams (e.g. VC and Finance)	• Becomes the new home for both the network drives and team collaboration sites. • Used for shared work files.
